Biology! Bringing Science to Life

As applied life science progresses, becoming fully integrated into the biological, chemical, and engineering sciences, there is a growing need for expanding life sciences research techniques. Anticipating the demands of various life science disciplines, Laboratory Protocols in Applied Life Sciences explores this development. This book covers a wide spectrum of areas in the interdisciplinary fields of life sciences, pharmacy, medical and paramedical sciences, and biotechnology. It examines the principles, concepts, and every aspect of applicable techniques in these areas. Covering elementary concepts to advanced research techniques, the text analyzes data through experimentation and explains the theory behind each exercise. It presents each experiment with an introduction to the topic, concise objectives, and a list of necessary materials and reagents, and introduces step-by-step, readily feasible laboratory protocols. Focusing on the chemical characteristics of enzymes, metabolic processes, product and raw materials, and on the basic mechanisms and analytical techniques involved in life science technological transformations, this text provides information on the biological characteristics of living cells of different origin and the development of new life forms by genetic engineering techniques. It also examines product development using biological systems, including pharmaceutical, food, and beverage industries. Laboratory Protocols in Applied Life Sciences presents a nonmathematical account of the underlying principles of a variety of experimental techniques in disciplines, including: Biotechnology Analytical biochemistry Clinical biochemistry Biophysics Molecular biology Genetic engineering Bioprocess technology Industrial processes Animal Plant Microbial biology Computational biology Biosensors Each chapter is self-contained and written in a style that helps students progress from basic to advanced techniques, and eventually design and execute their own experiments in a given field of biology.

Principles of Biology

Een absolute aanrader voor moderne bedrijven die vooruit willen!;;;Innoveren kan op duizend en één manieren. De kunst is om op zoek te gaan naar uw eigen stijl en uw eigen 'road to innovation' die de balans houdt tussen creativiteit en discipline;;;De verschillende niveaus van innovatie op een rijtje: het team en de mensen, projecten, business units, ondernemingen en ecosystemen;;;Het geheel is een overzicht van een reeks inspirerende innovatiestrategieën, maar de hoofdstukken kunnen ook perfect apart gelezen worden Innovations are everywhere - and they matter. They matter because they change our lives, for better or worse,

and because they are the source of long-term growth. But is innovation always the best policy? Is 'now' necessarily the best time to innovate? And how exactly should we go about it? This book seeks to provide the answers to some of these questions. It is not a detailed manual for innovation, since experience suggests that there is no such thing as a simple set of successful innovation recipes, which work at all times and in all places. For this reason, the book - written for practising managers and students of company-level innovation - uses a case-based methodology from which readers can learn practical lessons. At the same time it provides examples of creative approaches followed by less publicly well-known, high-impact SME innovators, or by leading well-established firms applying less known, high-impact innovation strategies. It shows how innovators as diverse as Bongo, GreenPan, Studio 100, Cronos, Belgacom Mobile, Arteconomy, QOD, Sigasi, VIB, Janssen Pharmaceutica, and Alcatel-Lucent - companies which range from big to small, high-tech to low-tech, new to old, product-based to service-based, well known to less well known - have succeeded in completing their innovation journey. The cases discuss topics as varied as creativity, growth, product leadership, business model change, as well as finance and commercialisation. There are many possible roads to innovation. Successful innovation means defining your own road. The purpose of this book is to help you plan your journey along your own particular route. www.thebalancingactofinnovation.com

The Nature of Life

The book describes first the principle photon generation processes from nuclear reactions, electron motion and from discrete quantum transitions. It then focuses on the use of photons in various selected fields of modern natural and life sciences. It bridges disciplines such as physics, chemistry, earth- and materials science, proteomics, information technology, photoelectrochemistry, photosynthesis and spintronics. Advanced light sources and their use in natural and life sciences are emphasized and the effects related to the quantum nature of photons (quantum computing, teleportation) are described. The content encompasses among many other examples the role of photons on the origin of life and on homochirality in biology, femtosecond laser slicing, photothermal cancer therapy, the use of gamma rays in materials science, photoelectrochemical surface conditioning, quantum information aspects and photo-spintronics. The book is written for scientists and graduate students from all related disciplines who are interested in the science beyond their immediate research field. It is meant to encourage interdisciplinary research and development in an age where nanoscience results in a convergence of formerly more disparate science.

Laboratory Protocols in Applied Life Sciences

Concepts in Biology is a short, student-friendly text organized in a traditional manner. It has very little botany and presents a human-oriented approach to the animal unit. Professors and students appreciate the low cost of this title, and that it is written for students who are not biology majors.

The Balancing act of Innovation
